

## Ch. 12 - Food Resources

### **How is Food Produced?**

### **What Plants and Animals Feed the World?**

15 plant and 8 animal species supply 90% of our food

wheat, rice and corn provide ~50% of the calories people consume; all three are annuals

2/3 of the world's people live primarily on grains (rice, wheat and corn)

### **The Two Major Types of Food Production**

#### 1. Industrialized agriculture (high-input agriculture)

uses large amts. of fuel energy, water, commercial fertilizers & pesticides

Plantation agriculture (cash crops)

#### 2. Traditional subsistence agriculture

Traditional intensive agriculture

### **The Green Revolution (1950-1970)**

Increased yields per unit of area of cropland

Involves three steps

developing and planting monocultures of key crops

lavishing fertilizer, pesticides and water on crops to produce high yields

increasing the intensity and frequency of cropping

A second green revolution (1967+)

began when fast-growing dwarf varieties of rice and wheat were introduced into developing countries

## **Case Study: Food Production in the U.S.**

Production doubled since 1940

Agribusiness -

Each US farmer feeds about 140 people

## **How Are Livestock Produced?**

10% of the world's land is suitable for producing crops

20% is used for grazing cattle and sheep

Developed countries consume >50% of the world's grain

Poor developing countries eat mostly grain and live low on the food chain

## **Traditional Agriculture**

Interplanting - simultaneously grow several crops on the same plot of land

Common interplanting strategies:

1. Polyvarietal cultivation
2. Intercropping
3. Agroforestry (alley cropping)
4. Polyculture

## **World Food Problems**

1950-1990: amount of food traded in the world market quadrupled

population growth is outstripping food production

Factors leading to the slowdown in the growth of per capita grain production:

population growth

increasing affluence (incr. demand for food, esp. meat products)

degradation and loss of cropland

little growth in irrigation since 1980

10% decline in global fertilizer use between 1989-1997

### **How many people can the world support?**

Earth's carrying capacity depend on:

quality of life (cultural carrying capacity)

whether future food production can be increased

the length of the food chain (grain eaters vs. meat eaters)

### **Undernutrition, Malnutrition and Overnutrition**

#### 1. Undernutrition

Chronically undernourished -

Seriously undernourished -

#### 2. Malnutrition

Marasmus – a diet low in calories and protein

Kwashiorkor – severe protein deficiency

The number of chronically undernourished fell from 36% to 14% (1970-1995)

The number of chronically malnourished fell from 940 million to 840 million (1970-1995)

Vitamin and mineral deficiencies (iron and iodine)

#### 3. Overnutrition

obesity, coronary heart disease, cancer, stroke, diabetes

Healthy Diet: largely vegetarian, 10% of calories from fat,

### **Can we produce enough food to feed the world's people?**

goods news -

bad news -

### **The principal cause of hunger and malnutrition is poverty**

#### **Environmental Effects of Producing Food:**

Soil erosion

desertification

salinization

waterlogging

water deficits

droughts

loss of wild species

#### **Environmental constraints that limit food production:**

Increased UV radiation from ozone-layer depletion

Projected global warming

#### **Increasing World Food Production**

The gene revolution - bioengineering

Food production: from exponential growth to logistic growth

monoculture vs. polyculture

## **Can we cultivate more land to increase crop production?**

36% of the world's land is devoted to raising crops.

Clearing Rain Forests (?)

Desert areas (?)

A major economically profitable and environmentally sustainable expansion of cropland is unlikely over the next few decades.

## **Catching and Raising More Fish**

Fisheries

Overfishing

Sustainable Yield

Commercial Extinction

Habitat Degradation

Destruction of wetlands, estuaries, coral reefs, salt marshes and mangroves;  
pollution of coastal areas

## **Aquaculture - "The Blue Revolution" - Two basic types:**

Fish Farming

Fish Ranching

Advantages - efficient and high yields in a small volume of water

Problems: require large inputs of land, feed, water and energy; produce large outputs of wastes

Pesticide runoff

## **Agricultural Policy, Food Aid and Land Reform**

1. Keep food prices artificially low
2. Give farmers subsidies to keep them in business, and encourage food production
3. Eliminate most or all price controls and subsidies

Sustainable Agriculture (low-input agriculture)

Guidelines for sustainable agriculture (p.305)
